8

**Como** desarrollador de aplicaciones distribuidas, **quiero** un sistema que gestione objetos sincronizables, permitiendo definir su especificación, estado y versiones, **para** asegurar que los datos se mantengan consistentes entre diferentes nodos y se puedan actualizar, consultar o eliminar de forma controlada.

As a developer of distributed applications, I want a system that manages synchronizable objects, allowing the definition of their specification, state, and versions, so that data remains consistent across different nodes and can be updated, queried, or deleted in a controlled manner.

@startuml

```

class Spec {
    + value
    + index
    --
    filter(quants)
    pattern()
    sort()
    get(quant)
    has(quant)

    ..
    token(quant) : quant
    version()
    method()
    type()
    id()
    source()

    ..
    add(spec,quant)
    toString()
}

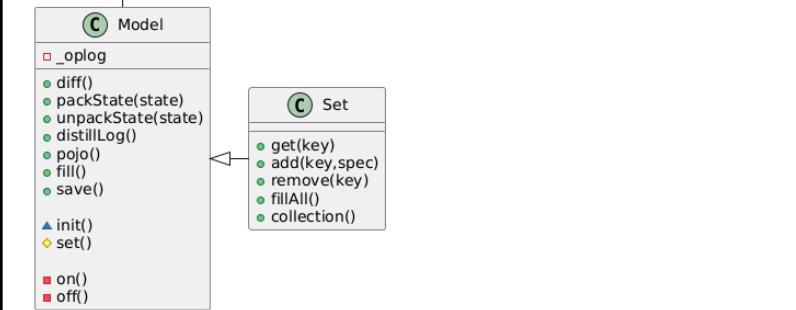

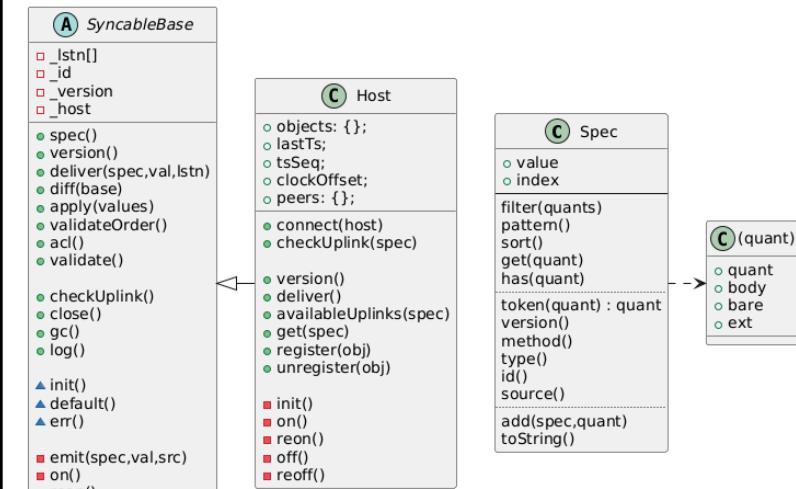

class "Spec.Map" as SpecMap {
    + map: {}

    + add(versionVector)
    + covers(version)
    + toString(trim)
}

class "(quant)" as qq {
    +quant
    +body
    +bare
    +ext
}

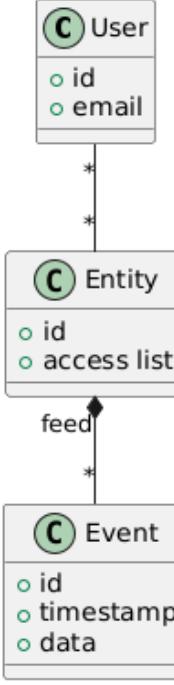

Spec .> qq

```

```

**Como** operador de un sistema de captura y transmisión de datos, **quiero** que los módulos de recepción de comandos, sensores y datos Kinect gestionen la adquisición, el procesamiento y la visualización de la información en tiempo real, **para** poder controlar el dispositivo de manera remota, supervisar su estado mediante los datos de sensores y obtener una representación visual confiable del entorno capturado por la cámara Kinect.

As an operator of a data capture and transmission system, I want the command reception, sensor, and Kinect data modules to manage the acquisition, processing, and visualization of information in real time, so that I can remotely control the device, monitor its status through sensor data, and obtain a reliable visual representation of the environment captured by the Kinect camera.

@startuml

```

class Command {

**Como** desarrollador de pruebas de dispositivos USB, **quiero** definir modos de operación síncrono y asíncrono con procedimientos de inicialización, manejo de contexto y ejecución de pruebas, **para** simular datos, ejecutar pruebas y obtener resultados de manera controlada y flexible según el modo de operación seleccionado.

As a developer of USB device testing, I want to define synchronous and asynchronous operation modes with initialization procedures, context handling, and test execution, so that I can simulate data, run tests, and obtain results in a controlled and flexible manner according to the selected operation mode.

```
@startuml
Mode <|-- SynchMode
Mode <|-- AsynchMode
Class Mode {
    + Mode()
    +{abstract} generateSymulatedData()
    +{abstract} printFinalInformation()
    +{abstract} initProcedures()
    +{abstract} getContext()
    +{abstract} getDeviceHandle()
    +{abstract} proceedWithInitUsb()
    +{abstract} closeLibUsb()
    +{abstract} doTest()=0
#_bufforSize
#_count
#_vid
#_pid
#_timeResult
#_debugPrinter
#_printOnlyResult
#_ctx
#_dev_handle
}
class SynchMode {
    +SynchMode()
    +{abstract} doTest()
}
class AsynchMode {
    +AsynchMode()
    +{abstract} doTest()
    +{abstract} initProcedures()
    +{abstract} closeLibUsb()
    -_sender_lock
    -_receiver_lock
    -_sender_cond
    -_receiver_cond
    -_senderTransfer
    -_receiverTransfer
    -_receiverThread
}
@enduml
```

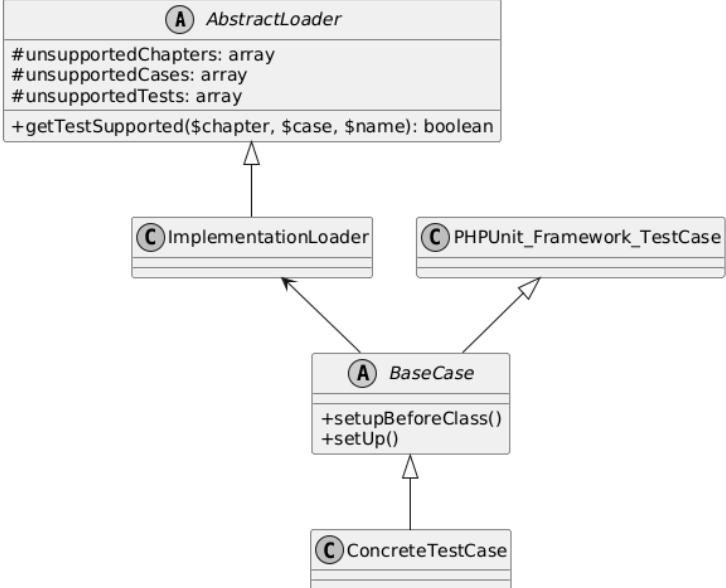

51	<p><b>Como</b> desarrollador del sistema, <b>quiero</b> que el logueo del sistema funcione como un singleton capaz de gestionar múltiples appenders (RollingFileAppender, ConsoleAppender, AndroidAppender) y distintos niveles de severidad (Severity), <b>para</b> registrar mensajes del sistema de forma centralizada y consistente, aplicando diferentes formatos (CsvFormatter, TxtFormatter, FuncMessageFormatter) y conversores (UTF8Converter) según sea necesario.</p>	<p>As a system developer, I want the system logging to function as a singleton capable of managing multiple appenders (RollingFileAppender, ConsoleAppender, AndroidAppender) and different severity levels (Severity), so that system messages can be recorded centrally and consistently, applying different formats (CsvFormatter, TxtFormatter, FuncMessageFormatter) and converters (UTF8Converter) as needed.</p> <pre> @startuml class Logger&lt;int instance&gt; &lt;&lt;singleton&gt;&gt; {     +addAppender()     +getMaxSeverity()     +setMaxSeverity()     +checkSeverity()     -maxSeverity     -appenders }  class RollingFileAppender&lt;Formatter, Converter&gt; class ConsoleAppender&lt;Formatter&gt; class AndroidAppender&lt;Formatter&gt;  Logger "1" o-- "0..n" RollingFileAppender Logger "1" o-- "0..n" ConsoleAppender Logger "1" o-- "0..n" AndroidAppender  class CsvFormatter {     {static} header()     {static} format() }  class TxtFormatter {     {static} header()     {static} format() }  class FuncMessageFormatter {     {static} header()     {static} format() }  class UTF8Converter {     {static} header()     {static} convert() }  enum Severity {     none, fatal, error, warning, info, debug, verbose } </pre>

**Como** desarrollador de sistemas de comunicaciones, **quiero** modelar una red con nodos, flujos y rutas que puedan ser analizados por un algoritmo y cargados desde un archivo XML, **para** que pueda calcular métricas de rendimiento, tiempos de respuesta y planificar la gestión de flujos de manera eficiente dentro de la red.

As a communications system developer, I want to model a network with nodes, flows, and routes that can be analyzed by an algorithm and loaded from an XML file, so that I can calculate performance metrics, response times, and efficiently plan flow management within the network.

```

@startuml
class Network{
    Flow <> flow
    Node <> node
    int lmax
    int lmin
    void init()
}

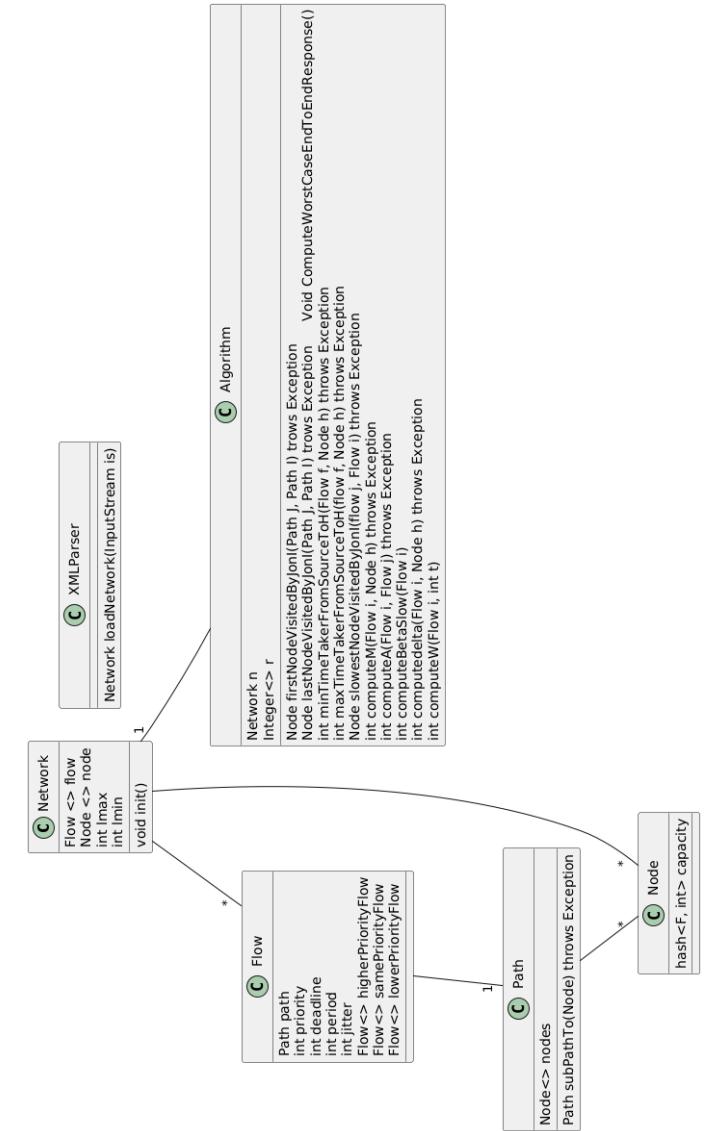

class Flow{
    Path path
    int priority
    int deadline
    int period
    int jitter
    Flow <> higherPriorityFlow
    Flow <> samePriorityFlow
    Flow <> lowerPriorityFlow
}

class Path{
    Node <> nodes
    Path subPathTo(Node) throws Exception
}

class Node{
    hash<F, int> capacity
}

class Algorithm{
    Network n
    Integer <> r
    Node firstNodeVisitedByJonl(Path J,
    Path I) trows Exception
    Node lastNodeVisitedByJonl(Path J,
    Path I) trows Exception
    Void ComputeWorstCaseEndToEndResponse()
    int minTimeTakerFromSourceToH(Flow f,

Como estudiante de lógica matemática, quiero representar y manipular diferentes tipos de fórmulas (atómicas, temporales, falsas, implicaciones y axiomas) organizadas en una estructura clara, para poder analizar, almacenar y recuperar axiomas de manera eficiente dentro de un sistema basado en las reglas de Hilbert.

As a student of mathematical logic, I want to represent and manipulate different types of formulas (atomic, temporal, false, implications, and axioms) organized in a clear structure, so that I can analyze, store, and retrieve axioms efficiently within a system based on Hilbert's rules.

@startuml

```

class AtomicFormula {
    AtomicFormula()
    AtomicFormula(char * symbol)
    AtomicFormula(AtomicFormula& formula)
    ~AtomicFormula()
    void SetValue(bool value)
    void NegValue()
    unsigned GetHash()
    char * GetSymbol()

    #char * m_symbol
    #unsigned m_hash
    #bool m_value
}

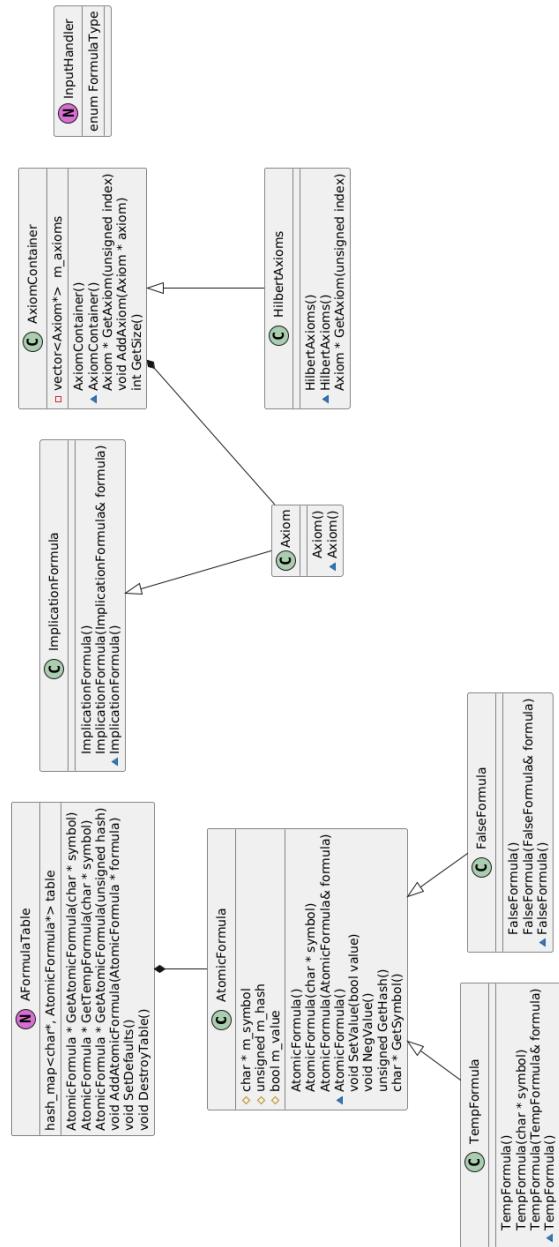

class TempFormula {
    TempFormula()
    TempFormula(char * symbol)
    TempFormula(TempFormula& formula)
    ~TempFormula()
}

class Axiom {
    Axiom()
    ~Axiom()
}

class FalseFormula{
    FalseFormula()
    FalseFormula(FalseFormula& formula)
    ~FalseFormula()
}

class HilbertAxioms {
    HilbertAxioms()
}

```

```
    ~HilbertAxioms()
    Axiom * GetAxiom(unsigned index)
}

class AxiomContainer {
    AxiomContainer()
    ~AxiomContainer()
    Axiom * GetAxiom(unsigned index)
    void AddAxiom(Axiom * axiom)
    int GetSize()

    -vector<Axiom*> m_axioms
}

class ImplicationFormula {
    ImplicationFormula()

    ImplicationFormula(ImplicationFormula&
formula)
    ~ImplicationFormula()
}

class AFormulaTable << (N, orchid) >> {
    AtomicFormula *
    GetAtomicFormula(char * symbol)
    AtomicFormula *
    GetTempFormula(char * symbol)
    AtomicFormula *
    GetAtomicFormula(unsigned hash)
    void
    AddAtomicFormula(AtomicFormula *
formula)
    void SetDefaults()
    void DestroyTable()

    hash_map<char*, AtomicFormula*>
table
}

class InputHandler << (N, orchid) >> {
```

```
    enum FormulaType
}

AFormulaTable *-- AtomicFormula
AtomicFormula <|-- FalseFormula
AtomicFormula <|-- TempFormula
ImplicationFormula <|-- Axiom
AxiomContainer <|-- HilbertAxioms
AxiomContainer *-- Axiom

**Como** investigador que trabaja con simulaciones científicas, **quiero** organizar y almacenar partículas, mallas y retículas en un sistema estructurado, **para** gestionar de manera clara los datos de mis experimentos y facilitar su análisis posterior.

As a researcher working with scientific simulations, I want to organize and store particles, meshes, and grids in a structured system, so that I can clearly manage the data from my experiments and facilitate subsequent analysis.

```
@startuml

class H5CUDS as "H5CUDS(Group)" {
    particle : Group = Particle
    mesh : Group = Bond
    lattice : Group = Lattice
    -- Node Attributes --
    cuds_version: int
}

class Particle as "Particle(Group)" {
    _v_name : string = "particle"
    children of type H5Particles
}

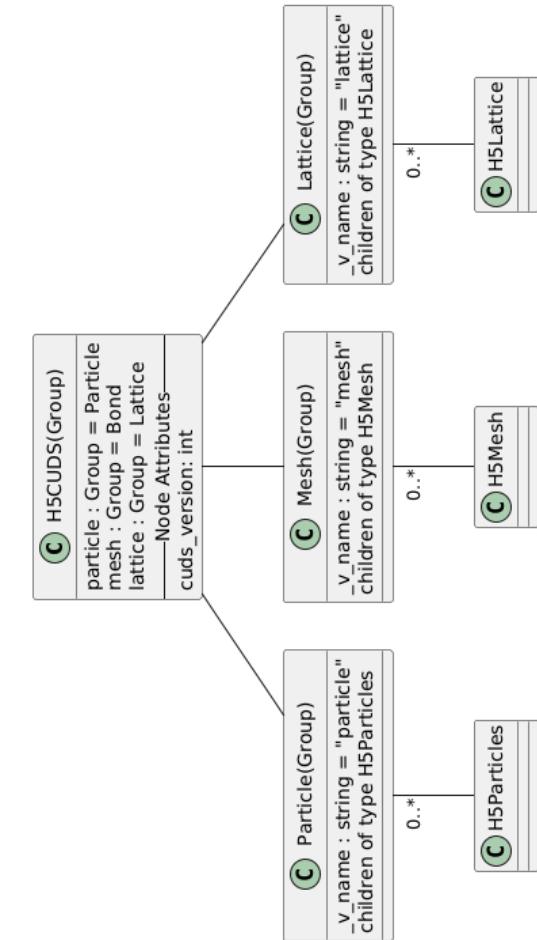

class Mesh as "Mesh(Group)" {
    _v_name : string = "mesh"
    children of type H5Mesh
}

class Lattice as "Lattice(Group)" {
    _v_name : string = "lattice"
    children of type H5Lattice
}

H5CUDS -- Lattice
H5CUDS -- Particle
H5CUDS -- Mesh

Lattice "0..*" -- H5Lattice
Mesh "0..*" -- H5Mesh
Particle "0..*" -- H5Particles
